AB Twenty-two tricyclo[4.2.1.0<sup>2,5</sup>]non-7-ene (TCN) or 3-oxatricyclononene monomers, having fluorinated or nonfluorinated substituents on the four-membered rings, were prepared by cycloaddn. reactions of functionalized olefins with norbornadiene or quadricyclane. Radical polymns. with tetrafluoroethylene (TFE) and/or TFE and acrylates provided amorphous polymers with high solubility in standard organic solvents. The TFE/TCN dipolymers typically have glass transition temps. of over 200° C, substantially higher than TFE copolymers with norbornene. Perfluoroalkyl sulfonyl fluoride groups can be incorporated in the side chains of the TCN monomers giving soluble copolymers. Polymers which also incorporated acrylate monomers were prepared using a semibatch process to control composition. Selected polymers incorporating tertiary alkyl ester groups from the TCN monomer or acrylates have shown good image formation when compounded with a photoacid generator, imaged with 157 or 193 nm light, and developed using aqueous base.

AB Cycloaddn. reactions of norbornadiene with fluorinated carbonyl derivs. (hexafluoro-acetone, dichlorotetrafluoroacetone, trifluoroacetonitrile, and N-trifluoroacetylhexafluoro-propan-2-imine) were studied. The reactions followed the concerted mechanism. The reaction with bis(trifluoromethyl)ketene gave a mixture of tricyclene [2 + 2]- and [2 + 2 + 2]-cyclo-adducts.

AB The invention provides cyclic fluorine compds. I, wherein R1 = halogeno and R2, R3 = H or a hydrocarbon group which is a straight-chain, branched, or cyclic C1-25 hydrocarbon group or an aromatic hydrocarbon group and may contain halogen, oxygen, nitrogen, or sulfur. The invention discloses (i) polymerizable fluoro- monomers derived from the compds., (ii) fluoropolymers obtained by polymerization or copolymn. of the compds. or fluoromonomers, (iii) resist materials containing the fluoropolymers, and (iv) a method for pattern formation by using the fluoropolymers. The invention can provide polymers suitable for resist materials (particularly, vacuum-UV resist materials) which exhibit high transparency in a wide wavelength region of from UV region to near IR region, high tight adhesion to substrates, excellent film-forming properties, high etching resistance, and high glass transition temps. The method for pattern formation by using the fluoropolymers is suitable for the formation of high-resolution patterns. Thus, 14.2 g 4,4-bis(trifluoromethyl)-3- oxatricyclo[4.2.1.0<sup>2,5</sup>]nonanol and 2.9 g paraformaldehyde were reacted in the presence of hydrochloride, and reacted with 2-(trifluoromethyl)-2- propenoic acid to give a fluoro-containing ethylenically unsatd. monomer, 4.8 g of which was polymerized with 2.8 g  $\alpha,\alpha$ -bis(trifluoromethyl)- bicyclo[2.2.1]hept-5-ene-2-ethanol at 60° for 20 h to give a copolymer with Mw 12,100 and polydispersity 1.5, which was dissolved in propylene glycol Me acetate, 2 parts TPS 105 acid generator was added therein, applied on a silicon wafer, prebaked at 120°, irradiated through a photomask by an UV-ray, and developed, showing good adhesion, developability, and good etchability.

AB A novel fluorinated cyclic compound which has an oxacyclopentane or oxacyclobutane structure derived from a norbornadiene compound and hexafluoroacetone and which may be represented by the following formula I or II (R1-5 = H, alkyl, hydroxy, halo, halogenated alkyl, carbonol, hexafluorocarbonol); a fluoropolymer obtained by polymerizing or copolymerizing the fluorinated cyclic compound or a derivative thereof; an excellent resist material comprising the fluoropolymer; and a method of forming a fine pattern with the resist material.

AB Quadricyclane readily undergoes [2+2+2] cycloaddn. reactions with electron-deficient fluorinated carbonyl compds., such as hexafluoroacetone, trifluoroacetyl chloride, Me trifluoropyruvate,  $\alpha$ -(fluorosulfonyl)difluoroacetyl fluoride, and bis(trifluoromethyl)ketene, to give polyfluorinated 3-oxatricyclo[4.2.1.0<sup>2,5</sup>]non-7-enes I (R<sub>1</sub> = F, R<sub>2</sub> = F, F<sub>3</sub>C, FSO<sub>2</sub>CF<sub>2</sub>; R<sub>1</sub> = F<sub>3</sub>C, R<sub>2</sub> = Cl, Me, F<sub>3</sub>C, MeO<sub>2</sub>C, F<sub>3</sub>CCO, Ph, PhO; etc.) in high yields. Although trifluoroacetyl fluoride is less reactive, it slowly interacts with quadricyclane at ambient temperature. 1,1,1-Trifluoroacetone, trifluoroacetophenone, carbonyl difluoride, and CF<sub>3</sub>C(O)OC<sub>6</sub>F<sub>5</sub> require higher temps. (60-90°) for the reaction, and Et trifluoroacetate is unreactive at 90°. Heating quadricyclane with the Et hemiacetal of trifluoroacetaldehyde gives the corresponding cycloadduct I (R<sub>1</sub> = H; R<sub>2</sub> = F<sub>3</sub>C) in 44% yield. The oxetane product from hexafluoroacetone is remarkably stable to both acids and bases, whereas the oxetanes with  $\alpha$ -F or Cl leaving groups are sensitive to acid-catalyzed rearrangement.

AB The present invention provides novel fluorine-containing copolymers which comprise at least one fluorinated olefin, at least one polycyclic ethylenically unsatd. monomer with a fused 4-membered heterocyclic ring and, optionally, other components. The copolymers are useful for photoimaging compns. and, in particular, photoresist compns. (pos.-working and/or neg.-working) for imaging in the production of semiconductor devices. The copolymers are especially useful in photoresist compns. having high UV transparency (particularly at short wavelengths, e.g., 157 nm) which are useful as base resins in resists and potentially in many other applications.

\* STRUCTURE DIAGRAM TOO LARGE FOR DISPLAY - AVAILABLE VIA OFFLINE PRINT \*

AB Reaction between furan and the dialkynyl ester (CF<sub>3</sub>C.tplbond.C)2CPhO2CPh in dichloromethane at 50° gave four rearranged 1:1 adducts, (benzoyloxybenzylidene)bis(trifluoromethyl)oxatricyclononadiene (Z)-I (R = Ph) (major product), benzoyloxybis(trifluoromethyl)tetrahydroepoxymethenocyclopropafluorene II, the corresponding 3H-compound III, and dibenzoylbis(trifluoromethyl)oxatetracyclononene IV (X = O, R = Ph) via the common intermediate benzoyloxyphenylbis(trifluoromethyl)oxapentacyclod ecene V (X = O, R = Ph) formed from the Diels-Alder adduct by intramol. ( $\pi 2s + \pi 2s + \pi 2s$ ) cycloaddn. The corresponding reaction with the ester (CF<sub>3</sub>C.tplbond.C)2CMeO2CMe gave analogously the diketone IV (X = O, R = Me) (major product) and a mixture of the (E)- and (Z)-I (R = Me); a 2:1 adduct,

acetoxymethylbis(trifluoromethyl)dioxahexacyclopentadecadiene VI was also isolated. A mixture of cyclopentadiene and (CF<sub>3</sub>C.tplbond.C)2CPhO2CPh (2:1 molar ratio), heated at 50°, yielded mainly the bis-Diels-Alder adduct bis(3-trifluoromethylbicycloheptadienyl) benzyl benzoate VII (X = CH<sub>2</sub>, R = Ph), together with the rearranged 1:1 adduct, diketone IV (X = CH<sub>2</sub>, R = Ph). Similarly, the major product from the reaction of an excess of cyclopentadiene with (CF<sub>3</sub>C.tplbond.C)2CMeO2CMe at 50° was the bis-Diels-Alder adduct VII (X = CH<sub>2</sub>, R = Me), but a 1:1 molar ratio of reactants at 20° give the mono Diels-Alder adduct (trifluoromethylbicycloheptadienyl)(trifluoropropynyl)ethyl ethanoate VIII (X = CH<sub>2</sub>, R = Me) in high yield. The bis adduct VII (X = CH<sub>2</sub>, R = Ph) was stable at 50C, but the mono adduct VIII (X = CH<sub>2</sub>, R = Me) underwent slow intramol. ( $\pi 2s + \pi 2s + \pi 2s$ ) cycloaddn., cf., the furan reactions, and the intermediate V (X = CH<sub>2</sub>, R = Me) so formed rearranged to a mixture of IV (X = CH<sub>2</sub>, R = Me) and acetoxy[bis(trifluoromethyl)tetracyclononenyl]ethene IX. In the presence of traces of water, the ketone IV (X = CH<sub>2</sub>, R = Me) was only a minor product with the major products being the substituted ethene IX and two diastereoisomers of acetoxy[bis(trifluoromethyl)tetracyclononenyl]ethanol X.

AB Reaction of furan with the dialkynyl ester (CF<sub>3</sub>C.tplbond.C)2CRO2CR(I; R = Ph) in CH<sub>2</sub>Cl<sub>2</sub> at 50° affords a mixture of four 1:1 adducts, e.g., diketone II (R = Ph), via the common intermediate 2-benzoyloxy-2-phenyl- 4,10-bis(trifluoromethyl)-7-oxapentacyclo[4.4.0.01,3.05,9.08,10]dec-3-ene, formed from the bis Diels-Alder adduct by intramol. (π2s + π2s + π2s) cycloaddn. followed by retro-cleavage of furan; the corresponding reaction with the ester I (R = Me) gives analogously diketone II (R = Me) as major product and various other products were also formed.

AB The title compds. improve the stability of alkyd resins. A thick walled glass reactor, 24 diameters long and internal capacity 150 cc. was evacuated, cooled in a liquid N bath, and charged with a mixture of 8.5 parts perfluorocyclobutanone and 6 butadiene. The glass reactor was sealed and the reactor and its contents exposed overnight to the radiation from an 85 watt Hg vapor lamp with a glass envelope permitting transmission of no radiation of wavelength below 2800 A. The reactor was cooled, opened, and at liquid N temps. connected to a low-temperature still. There was recovered 2 of 33% butadiene, b. -5°. The remaining liquid was filtered and the filtrate purified by fractionation to give 72% 1,1,2,2,3,3-hexafluoro-5-oxaspiro[3,5]non-7-ene, liquid, b. 137°, n<sub>25D</sub> 1.370. Similarly were prepared 1,1,2,2,3,3-hexafluoro-6,9-methano-5-oxaspiro [3,5] non-7-ene, liquid, b<sub>10</sub> 51°, n<sub>25D</sub> 1.3865, 1,4,5-methenocyclopenta-[c]tetrahydrofuran-3-spiro-2',2',3',3',4',4'- hexafluorocyclobutane (I), liquid, b<sub>18</sub> 88°, n<sub>25D</sub> 1.4901, 1,1,2,2,3,3-hexafluoro-7(and 8)-methyl-5-oxaspiro[3,5]non-7-ene, liquid b.153°, 1-bromo-1,2,2,3,3-pentafluoro-7,8-dimethyl-5-oxaspiro[3,5]non-7-ene, liquid, b<sub>8</sub> 80-1°, 1,1-dichloro-2,2,3,3-tetrafluoro-7,8-dimethyl-5-oxaspiro[3,5]non-7-ene, b<sub>7</sub> 857.5° 2,2,3,3-tetrafluoro-5-oxaspiro[3,5]non-7-en-1-one, light yellow liquid, b<sub>28</sub> 67° 2,2,3,3-tetrafluoro-1,1-dihydroxy-5-oxaspiro[3,5]non-7-ene, needles, m. 74-7°.
